

THE DAYLIGHT DIAL

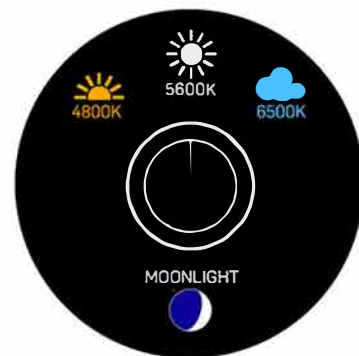

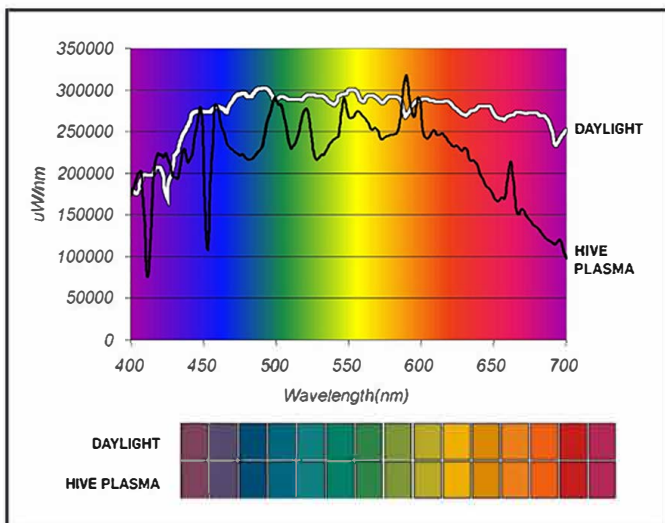

Hive's V.C.T. System

HIVE'S ADJUSTABLE DAYLIGHT:

Launched with the Bee Plasma Flood, and now available on all of Hive's lights, the Daylight Dial offers fully tunable Variable Color Temperature (VCT) from 4600K – 7000K degrees Kelvin. As well as the ability to shift all the way to a deep blue moonlight. The Daylight Dial allows the user to track the natural shift of the Sun over the course of a day and warm or cool a scene creatively without the use of gels.

The Daylight Dial sends a small voltage signal, which changes the chemical composition of the plasma reaction inside the bulb. This allows the VCT system to change the color temperature of the Hive fixture with the simple turn of a dial, taking a mere 10 seconds to shift the bulbs color throughout the entire daylight range. While shifting the white light emitted across the kelvin scale, it preserves plasma's full spectrum output without any green/magenta shift.

Hive's Plasma light remains a full spectrum source from 4600K - 7000K

Dial control system with suggested Color Temperatures.
